JQuery Waypoints

Name: Allison Sharpe
Date: 08-13-15

Why I Chose JQuery – Waypoints:

Although Waypoints isn't necessarily a required feature in order to fully operate JQuery, I found it to be very useful since its existence is to point out exactly where the user is on a page. For example: "You are 20px at the top of the page." The reason I chose this plugin in particular is because I enjoy learning new things and since Waypoints doesn't seem to be a very popular plugin, I thought I'd learn as much as I can and hopefully, I can educate someone else about this plugin in the future.

How I Felt About the Presentation:

I enjoyed working with RevealJS. It was a bit confusing at first, but overall, it was very helpful and I learned a lot while working with it. The part I enjoyed the most was customizing my theme as well as my sections for each slide. Before starting this project, I honestly never knew that you could create a presentation from HTML. The presentation itself was pretty simple for me since I've worked with presentations my entire life. At first I was a bit nervous because I wasn't very sure how I could put everything together, especially since it was my first time working with an HTML5 presentation, but after I gathered all of my information and placed it into the HTML, I realized it wasn't as hard as I thought it would be. Overall, I thoroughly enjoyed this assignment.
